

# Wobble Chuck to fit Patriot RSWC

The Wobble Chuck is an inexpensive introduction to off-centre or eccentric turning, the Wobble Chuck fits in the standard 2" jaws of the Patriot chuck in the same manner as a faceplate ring. The workpiece can be held by three screws - like a faceplate - or by a single wood screw - like a screw chuck - or by both means. It is then off-set by rotating the upper section of the Wobble Chuck. Ideal for goblets with off-set stems. A great opportunity to experiment with novel projects.

Wobble Chuck is shown held in a Patriot Chuck [available seperately]
