

insulated VDE - Phillips PH driver for work on electrical installations

As with all Wera tools, safety in use is a priority. With this in mind each tool is individually tested under a 10,000 volt load in a water bath to determine dielectric strength and guarantee the integrity of the insulation.

These screwdrivers feature Wera's patented "Kraftform" handle design, transferring greater torque to the fixing with less effort from the user.

The distinctive design aids identification and selection of the correct tool for the job.
