

2100 Series: Digital Rim Lock

2100 Series: Digital Rim Lock - With hold back facility

Zone digital door locks are robustly constructed and, if installed and maintained correctly, will give years of satisfactory service.

The locks are relatively simple to install on most types of doors, and combination codes can be easily changed.

The deadlocking latch provides additional security but the major security benefit on these type of keyless locks is that they eliminate the problems of lack of key control usually experienced on conventional locks.

Note, these digital door locks are not suitable for uPVC doors.
